RUBRIC

TOPIC	EVAL	OBSERVATIONS
1. Definition	8.5/10	The document is well written but lacks background information. Talk more about the problem.
2. SRS	8/10	It has 10 functional requirements, but the non-functional requirements are the interface and data management in the cloud.
3. Class and UC Diagrams	8/10	Generalize the requirements. Too many requirements. Some are the same as others and use verbs and missing cases in the case diagrams
4. ER (10 tables)/CSV (10files)	6/10	Does not have the required 10 csv, but the ones they have are very well structured.
5. Mockup	8.7/10	The mockup has the idea, but it's ambiguous It's a great idea for mckup but a better presentation it's more professional.
6-7. Clean Code	16/20	The code is very well structured, although it has some problems with class names, and some comments that could be reduced, but the code complies with the clean code standard.

8-9-. Functionality	17/20	The program works very well, although in some parts it is a little difficult to understand how the system works, it is quite functional and does its job, although it should be more solid.
10. persistence (consistency)	9/10	The program saves files correctly but lacks organization. The menu is overcrowded and file storage lacks a dedicated folder, causing minor disorder.
TOTAL	81.2/100	

EVIDENCE

3.1 Functional Requirements

Requirement ID:	RF01
Requirement Name:	User Authentication
Characteristics:	Users must authenticate to access the system.
Requirement Description:	The system will request a valid username and password to log in and access the main menu.
Non-Functional Requirement:	RNF01, RNF03, RNF04
Requirement Priority:	High

Requirement ID:	RF02
-----------------	------

2. Jorge Fuentes
3. Micaela Jácome
4. Isaac Maisincho

RUBRIC

TOPIC	EVAL	OBSERVATIONS
1. Definition	8/10	The document defines their project in a great way, but there are missing concepts in the background. A cover page might improve the document.
2. SRS	8.5/10	It follows the IEEE structure, it is easy to understand and keeps coherence. Section 3 fully meets the requirements, but Sections 1 and 2 are incomplete according to IEEE standards.
3. Class and UC Diagrams	6.5/10	UC: it isn't created by using verbs, so these use cases aren't valid. Class: There are 10 classes, but only the classes of the model are with associations, and the

		classes of view are without relations.
4. ER (10 tables)/CSV (10files)	6/10	The CSV files are in many folders, it's difficult to find them, and it's not well distributed, also there are only six CVS files
5. Mockup	8.5/10	Very clear and legible, it's easy for a external user understand the structure and options that the program has to offer, and also this menu has the name of the user that is seeing the menu, a good utility.
6-7. Clean Code	17/20	The code is well structured, the name of the methods are good but can be better, the name of the variables are good and the code is understandable
8-9-. Functionality	18/20	The code works well, some things didnt work like are supposed to work but it didnt give an error.
10. persistence (consistency)	8.5/10	CSV persistence works, but files lack folder organization. A structured directory and consistent naming would improve maintainability.
TOTAL	81/100	

EVIDENCE

1. Definition

Overview

Referring to the sales of artisan,we would focus on each product and its variants for each artisan selling in the market since many of them have similar products and prices, we will also take into account each artisan's attendance, the time they arrive and start their shift at the market, and their departure time.

Background

Based on the 10 artisans, they currently manage several manual lists to record attendance, sales, and products. However, this method presents drawbacks such as human error, lack of real-time updating, and difficulty generating accurate reports. Therefore, the proposal is to integrate a digital system that centralizes and automates these processes, making management much more efficient.

2. SRS

ID	TOPIC	As a...	I need to...	So that I can...	Inputs	Output
REQ001	Attendance Registration	Administrator	Record the daily attendance of artisans	Record the daily attendance of artisans	Date, arrival and departure time, artisan's name	Updated attendance record, penalties applied
REQ002	Product Registration	Artisan	Enter new products into the system	Keep the inventory of available products up to date	Product name, quantity, unit price	Product registered in the inventory
REQ003	Sales Registration	Artisan	Record each sale made	Control stock, generate revenue, and track sales statistics	Sold product, quantity, price	Sales record, updated stock
REQ004	Income Control	Administrator	Check total income generated from sales	Have clear visibility of the market's revenue	Date, artisan ID	Total income per period
REQ005	Product History	Artisan	View previously registered products	Review which products were entered and their status	Artisan ID	List of previous products
REQ006	Record Modification	Administrator	Edit incorrect information in sales or attendance	Correct errors without affecting the database	Record ID, new values	Updated record
REQ007	Date filter	Artisan/Administrator	Filter sales or attendance by a date range	Consult specific information for a defined period	Start date, end date	Filtered data by range
REQ008	Record Deletion	Administrator	Delete erroneous or duplicate records	Keep the database clean and accurate	Record ID	Deleted record
REQ009	Access with Username and Password	Artisan/Administrator	Log into the system	Protect information based on user role	Username, password	System access with permissions
REQ010	Low Stock Notification	Artisan	Notify artisans about low stock	Inform the Artisan	Product ID, stock product,	Message

RUBRIC

TOPIC	EVAL	OBSERVATIONS
1. Definition	7.2/10	Important theory is missing for the development of the solution to the problem. The Overview does not follow the
2. SRS	7/10	It does not follow the IEEE Structure. Correct requirement 10, 11 and 12, it 's the same.
3. Class and UC Diagrams	4/10	The use case diagram has a different format than requested, and the class diagram is incomplete because it has no multiplicity. 0/10 UC Diagrams 8/10 Class Diagram
4. ER (10 tables)/CSV (10files)	10/10	They have 10 CSV files containing patient data, medical histories, and related information.
5. Mockup	9/10	The menu design contains too many options, which could have been simplified by distributing them across other menus.
6-7. Clean Code	16/20	The code complies with clean code standards, although its naming could be more descriptive.
8-9-. Functionality	18/20	The code functions correctly; however, it lacks input validation, so entering non-numeric characters in numeric fields or invalid options in the menu causes the program to throw exceptions and crash.
10. Persistence (consistency)	9/10	The program includes file persistence; however, it does not have a dedicated folder for storage, so

		files are saved in the project's root directory, which indicates a minor lack of organization in the storage structure.

Workshop 1

Project: Medication reminder and vital signs monitoring system for elderly caregivers

Problem

We need a system that helps elderly caregivers monitor in a better way several medications daily that elder people take and also records their vital signs such as blood pressure, glucose levels, and oxygen saturation.

Overview

We will create a mobile application designed for caregivers, where they can:

- Receive medication reminders (time, dose, and patient name).
- Record whether the medication was administered or not.
- Register and maintain a historical record of daily vital signs measurements such as:
 - Blood pressure.
 - Blood glucose levels.

The screenshot shows a PDF document titled "HealthKeeper_UseCase_Summary" open in a web browser. The document content is as follows:

HealthKeeper Project - Use Case Summary

This document summarizes the main use cases developed for the HealthKeeper project. Each use case defines an interaction between the user and the system aimed at managing health-related data.

No.	Use Case Name	Primary Actor	Brief Description
UC1	Register User	User	Allows a person to create an account by entering personal information.
UC2	Log In	User	Validates user credentials to access the system.
UC3	Register Medication	User	The user adds a medication and

On the right side of the screen, a WhatsApp group voice call interface is visible, showing participants: Tamir, Geral, Julio PC, and You. The call is titled "Group voice call - WhatsApp".

1. Definition

SCOPE

- Registration of new merchandise entries with details such as description, name, price, date.
- Real-time registration of merchandise exits that reflect completed sales.
- Automatic updating of available stock per product and per location.
- Consolidation of inventory data from the four locations into one centralized platform.
- Ability to filter information by specific location or product.

METHODOLOGY (5W+2H FRAMEWORK)

The 5W+2H method (What, Why, Who, When, How, How Much) allows for a clear and logical structuring of the development of the inventory system.

1 INTRODUCTION

The "War Game" is a joint exercise done by military forces. This activity simulates emergency situations (such as floods, earthquakes, war situations, etc.). Its main objective is to evaluate the response capacity of a military group and measure the effectiveness of its procedures and personnel. They must cooperate with other state entities, such as the National Police or the Risk Management Secretariat, such as following established protocols and complete scheduled events.

Automation in crisis management contexts reduces human error, allocates resources more efficiently, and facilitates decision-making. With our system, it's possible to perform tasks such as role assignment, activity monitoring, and real-time event logging. This is especially useful in "War Games", where multiple entities are involved and every second counts. The use of specialized software improves the traceability of actions and allows for the issuance of detailed reports at the end of the exercise.

1.1 Document Purpose

The purpose of this document is to define the software requirements for the **War Game Activities Manager** system. It is intended to support the planning, execution and analysis of military simulated exercises, conducted by defense personnel for training and strategic evaluation.

1.2 Product Scope

This project is headed to develop a management system to support the planning, execution, and evaluation of activities done during the "Juego de Guerra" (War Game) exercise. The system will facilitate the coordination of operational units, the assignment of tasks, the tracking of resources, and the documentation of events in real time. It aims to improve the efficiency and effectiveness of decision-making during exercise development. The expected outcome of the project is the development and implementation of a system for managing the "War Game". The system will allow for efficient assignment of roles and resources, reducing the likelihood of human error. Develop a system that facilitates the assignment of roles and operational resources during the "War Game" simulation, improving efficiency and minimizing human error. Implement real-time monitoring of personnel actions and mission progress to ensure accurate situational awareness throughout the simulation.
